G, ROUND, BEVEL, MITER, MOVETO, SCROLL, UNITS and PAGES from wildcard import of tkinter (unused-wildcard-import)

```

Pylint output message types

- Convention(C)

It is displayed when the program is not following the standard rules.

- Refactor(R)

It is displayed for bad code smell.

- Warning(W)

It is displayed when that line execution results some error.

- Error(E)

It is displayed when that particular line execution results some error.

- Fatal(F)

It is displayed when pylint has no access to further process that line.

Issues

- 1) README.md:3:13: E0001: Parsing failed: 'invalid syntax (<unknown>, line 3)' (syntax-error)
 - Used when a syntax error is raised for a module
- 2) main.py:1:0: C0114: Missing module docstring (missing-module-docstring)
 - Used when a module has no docstring. Empty modules do not require a docstring.
- 3) main.py:1:0: W0401: Wildcard import tkinter (wildcard-import)
 - Used when `from module import *` is detected.
- 4) main.py:3:0: E0401: Unable to import 'pymysql'
 - Used when pylint has been unable to import a module.
- 5) main.py:12:0: C0103: Constant name "mypass" doesn't conform to UPPER_CASE naming style (invalid name)
 - Used when the name doesn't conform to naming rules associated to its type (constant, variable, class...).
- 6) main.py:12:0: E1101: Class 'Image' has no 'ANTIALIAS' member (no-member)
 - Used when a variable is accessed for an inexistent member.
- 7) main.py:1:0: W0614: Unused import(s)
 - Used when an imported module or variable is not used from a `from X import *` style import.
- 8) AddBook.py:1:0: C0103: Module name "Add Book" doesn't conform to snake case naming style (invalid-name)
 - Used when the name doesn't conform to naming rules associated to its type (constant, variable, class...).
- 9) AddBook.py:1:0: W0702: No exception type(s) specified (bare-except)
 - Used to catch all exceptions that signal program errors.
- 10) AddBook.py:45:4: W0601: Global variable 'bookInfo1' undefined at the module level (global-variable-undefined)
 - Used when a variable is defined through the `"global"` statement but the variable is not defined in the module scope

11) DeleteBook.py:20:0: C0116: Missing function or method docstring (missing-function-docstring)

- Used when a function or method has no docstring. Some special methods like `__init__` do not require a docstring.

12) DeleteBook.py:88:62: E0602: Undefined variable 'white' (undefined-variable)

- Used when an undefined variable is accessed.
